## Michelin Motorsport Technical Bulletin

### **Tire Storage & Transport**

Exposure to extreme temperatures or certain environmental conditions may adversely impact tire performance over the life of a competition tire. Michelin recommends the following guidelines be respected for tire storage and transportation.

Tire Type	Minimum Temperature	
	In Storage	During Transport
Slick	10°C/ 50°F	15°C/ 59°F
Wet	5°C/ 41°F	10°C/ 50°F

Tires should not be subjected to:

- Direct and prolonged exposure to sunlight
- Sources of high heat and humidity (Tropical condition storage)
- Long-term storage in stacks.
- Solvents, lubricants, fuel and other chemical products.
- Exposure to ozone emissions from equipment such as transformers, welding units, electric motors, etc.
- Long term warehouse or shop storage at temperatures in excess of 30°C/86°F.

Tires should be stored in:

- Dry, well-ventilated areas without direct light.
- Tire racks suitable for storing tires vertically to avoid prolonged, excessive pressure on the tire casing.

Following these recommendations will help to preserve the performance of your tires.
